

SecurityCore Fundamentals

Course Outline

This four module two-day course explains the basic elements of Information Security in a practical, understandable, and enjoyable manner.

This course is designed specifically to help you incorporate good security practices into your daily operations. You will leave this course with a greater appreciation for the alignment of security procedures with your business objectives.

You will learn how to mesh security procedures with reliable and cost-effective business operations, what the most commonly used tools are, and what the significance is of using proper security terms in the information security industry.

This course will prepare you for the function of security operations and how you should plan to respond effectively when an incident or breach occurs.

Course Content

This course is based on the ISO_IEC 27002:2005 standard, along with other internationally recognized standards and practices. It will illustrate the core fundamentals of information security and the ever-changing business requirements, along with concepts, processes, and design elements.

Each attendee will learn the relationship between Information Security and business, what risk means in the Information Security industry, what are the core fundamentals of Information Security, and how to design and implement effective security procedures, and how to properly manage incidents.

Who Should Attend?

This course is suitable for any member of the business and IT community, from the newest member of the team to the most experienced professional.
